

Average number of people newly diagnosed with HIV per day, selected years

NEWLY DIAGNOSED HIV CASES

In June 2018, there were 993 new HIV antibody seropositive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP) [Table 1]. Eighteen percent (174) had clinical manifestations of advanced HIV infection (WHO clinical stage 3 or 4) at the time of diagnosis.

Ninety-four percent (934) of the newly diagnosed were male. The median age was 27 years old (range: 3 - 73 years old). More than half (52%, 512) were 25-34 years old and 29% (287) were 15-24 years old at the time of testing.

One third (33%, 324) were from the National Capital Region (NCR). Region 4A (17%, 167 cases), Region 3 (12%, 123), Region 6 (7%, 66), Region 12 (6%, 58) and Region 7 (6%, 55) round off the top six regions with the most number of newly diagnosed cases for the month, together accounting for 80% of the total [Figure 2].

Sexual contact remains the predominant mode of transmission (98%, 977). Among this, 88% were from males who have sex with males (MSM). Other modes of transmission were needle sharing among injecting drug users (1%, 7) & mother-to-child transmission (<1%, 2). There were seven cases that had no data on mode of transmission.

Among the newly diagnosed females this month, four were pregnant at the time of diagnosis, three of the cases were from NCR and one case from Region 7.

Fig. 1: Number of newly diagnosed cases per month, 2016-2018

Table 1. Summary of HIV diagnoses and deaths

Demographic Data	Jun 2018	Jan-Jun 2018	Jan 2013-Jun 2018	Jan 1984-Jun 2018
Total reported cases	993	5,673	44,603	56,275

Fig. 2: Proportion by region of residence among newly diagnosed, June 2018

Anti-retroviral Treatment (ART)

In June 2018, there were 549 patients who were initiated on ART. The median CD4 of these patients upon enrollment was 173 cells/mm³.

A total of 28,045 people living with HIV (PLHIV) were presently on ART as of June 2018. Most (97%) were males. The age of reported cases ranged from 8 months to 77 years (median: 31 years old). Ninety-five percent were on first line regimen, 4% were on second line, and 1% were on other line regimen.

The total figure reflected on this section are the number of HIV positive adult and pediatric patients currently enrolled and accessing Anti-retro Viral (ARV) medication in 70 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV anymore. Lost to follow-up is considered once a person have failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

Note: May 2018 data was used for SPMC & NMCC due to late submission.

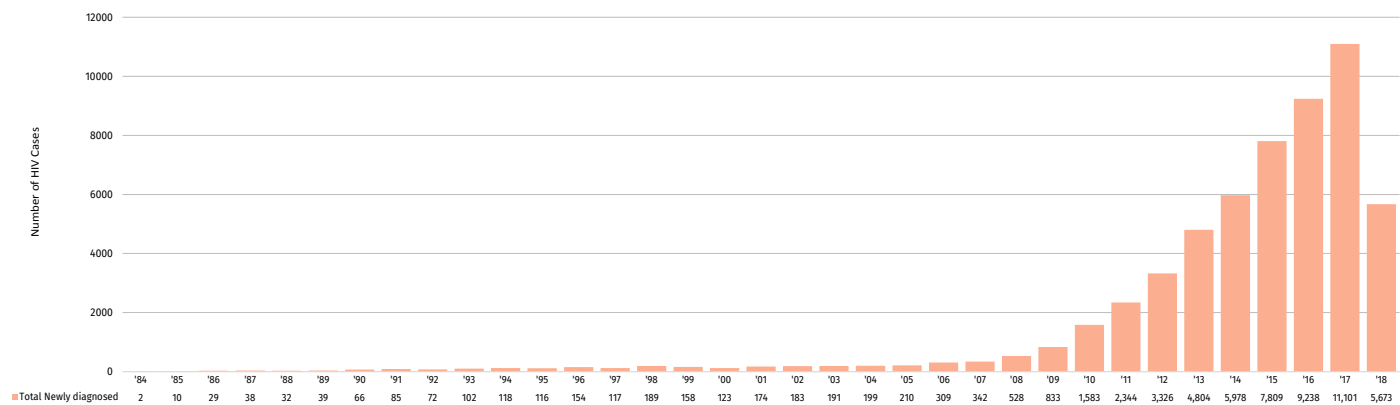

Fig. 3: Number of ART initiation per month, 2016-2018

HIV/AIDS EPIDEMIC TRENDS IN THE PHILIPPINES (January 1984 - June 2018)

The first case of HIV infection in the Philippines was reported in 1984. Since then, there have been 56,275 confirmed HIV cases reported to the HARP. Ninety-four percent (52,622) were male and 6% (3,642) were female; there were no data on sex for 11 cases. The median age was 28 years old (age range: 1 year - 82 years); no data on age for 73 cases. More than half (28,773 or 51%) were from the 25-34 year age group while 15,834 (28%) were youth 15-24 years old. Seventy-nine percent (44,603) of the total diagnosed cases in the Philippines were reported from January 2013 to June 2018. Eleven percent (6,040) of the total ever reported cases had clinical manifestations of advanced infection at the time of reporting (WHO clinical stage 3 & 4) [Table 1].

Fig. 4: Number of HIV cases reported in the Philippines by year, Jan 1984 to Jun 2018 (N=56,275)

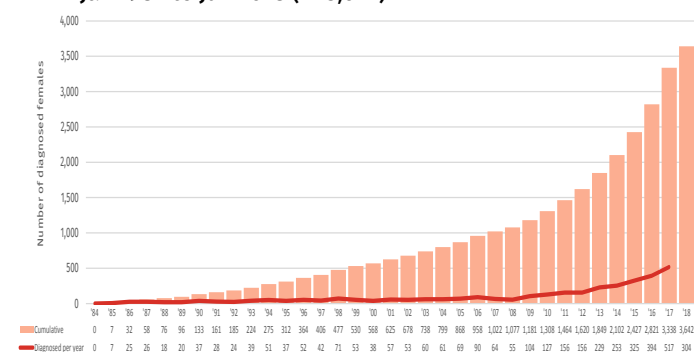

Age and sex

In the early years of the epidemic (1984-1990), 62% (133 of 216 cases) of those diagnosed were female. From 1991 to present, males comprised 94% (52,539) of the 56,048 diagnosed cases in the Philippines.

However, the number of diagnosed HIV infections among females has also been increasing [Figure 5]. The number of females diagnosed from Jan to Jun 2018 (304) was almost three times the number of diagnosed cases compared to the same period of 2013 (110), five years prior. Ninety-three

Fig. 5: Number of females diagnosed per year Jan 1984 to Jun 2018 (N=3,642)

Geographic distribution

From January 1984 to June 2018, the regions with the most number of reported cases were NCR with 22,620 (40%) cases, Region 4A with 8,295 (15%) cases, Region 7 with 5,098 (9%) cases, Region 3 with 5,068 (9%) cases, and Region 11 with 3,212 (6%) cases. Nineteen percent (10,844) of the cases came from the rest of the country (ROTC) while 1,138 (2%) did not report region of residence [Table 2].

Of the 3,642 females reported with HIV, 955 (26%) were from NCR, 579 (16%) were from Region 3, 447 (12%) were from Region 7, 376 (10%) were from Region 4A and 982 (27%) were from other regions while 303 (8%) had no reported data on region of residence.

percent (3,373) of all female cases were in the reproductive age group (15-49 years old) at the time of diagnosis.

The predominant age group among those diagnosed has shifted from 35-49 years old between 2001 to 2005, to 25-34 years old starting from 2006 [Figure 6]. The proportion of HIV positive cases in the 15-24 year age group increased from 25% in 2006-2010 to 29% in 2011-2018.

Fig. 6: Proportion of HIV cases by age group, Jan 1984 to Jun 2018

The regions with the most number of overseas Filipino workers (OFW) reported to HARP were from NCR with 1,998 (34%) cases, Region 4A with 998 (17%) cases, and Region 3 with 669 (11%) cases.

Table 2: Number of HIV cases diagnosed by region

^a No data on region of residence for 9 (<1%) cases
^b No data on region of residence for 1,138 (2%) cases

Modes of transmission

From January 1984 to June 2018, sexual contact among MSM was the predominant (84%, 44,242) mode of transmission among males, followed by male-female sex (11%, 5,941), and sharing of infected needles (4%, 1,965) [Table 3]. More than half (53%, 23,417) of MSM were 25-34 years old at the time of testing, and 31% (13,494) were 15-24 years old. Among diagnosed females, male-female sex was the most common mode of transmission (92%, 3,355) followed by sharing of infected needles (3%, 119)[Table 3].

A total of 144 children (less than 10 years old), eight adolescents (10-19 years old), and one adult foreigner (22 years old) were reported to have acquired HIV through mother-to-child transmission.

From 1984 to 2006, the predominant mode of transmission was male-female sex. From 2007, the trend shifted to sexual contact among MSM as the predominant mode of transmission and has remained as such to the present. From January 2013 to June 2018, 83% (36,817) out of the total (44,603) newly diagnosed cases were among MSM.

From 1984 to 2009, transmission through sharing of infected needles were <1% of the total cases reported. The proportion of cases of injecting drug users (IDU) increased sharply in 2010, at 9% (147) of the total cases reported that year. The proportion of new cases among people who inject drugs decreased to <6% of the total cases in succeeding years.

Table 3. Modes of HIV transmission

Mode of Transmission	Jun 2018 (N=993)		Jan–Jun 2018 (N=5,673)		Jan 2013–Jun 2018 (N=44,603)		Jan 1984–Jun 2018 (N=56,275) ^a	
	M ^a	F ^a	M	F	M	F	M	F

No data	7	0	35	0	96	6	383	83

^a Sex at birth; M= Male, F = Female

^b No data on sex for 11 cases

^c Among males only

Regional patterns vary across the modes of transmission. Forty-four percent of males who have sex with males ever diagnosed were from NCR; almost all (99%) reported with injecting drug use were from Region 7; and 33% of females who engaged in transactional sex were from Region 3.

Fig 7: Cumulative number diagnosed per year by mode of transmission, Jan 1984 to Jun 2018 (N=56,275)^a

^a No reported Mode of Transmission for (477) cases

^b Others include the following MOT: needle prick injury, blood/blood products, and mother-to-child transmission

SPECIFIC POPULATIONS

Youth (15-24 years old)

In June 2018, 287 (29%) cases were among youth 15-24 years old; 95% were male. Almost all (99%, 285) were infected through sexual contact (23 male-female sex, 187 male-male sex, 75 sex with both males & females). Two cases had no data on mode of transmission.

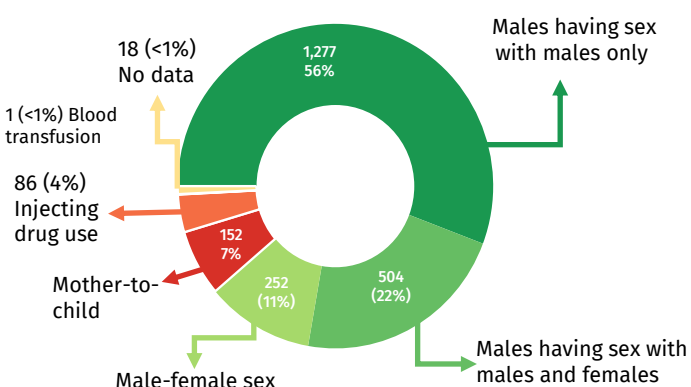

From January 1984 to June 2018, 15,834 (28%) of the reported cases were 15-24 years old. Ninety-six percent (15,272) were infected through sexual contact (1,778 male-female sex, 8,886 male-male sex, 4,608 sex with both males & females); 467 were infected through needle sharing among IDU, one was infected through mother-to-child transmission and 94 had no data on mode of transmission. Eighty-two percent (13,022 out of 15,834) of all those 15-24 years old at the time of testing were diagnosed from January 2013 to June 2018. From 1984 to 2002, 71% (179) of the cases among the youth were females. However, in 2003, there was an equal number (7) of males and females reported. Since then, the trend has shifted to male predominance.

Children (<10 yo) & adolescents (10-19)

There were 31 newly diagnosed adolescents 10-19 years old in June 2018. All were infected through sexual contact (5 male-female sex, 20 male-male sex, and 6 had sex with both males & females). There were two newly diagnosed child less than 10 years old and was infected through mother-to-child transmission.

Four percent (2,290) of all diagnosed cases from January 1984 to June 2018 were 19 years old and younger at the time of diagnosis. One hundred forty-seven out of the 2,290(6%) were children less than 10 years old, and among them 144 were infected through mother-to-child transmission; one through blood transfusion; and two had no data on mode of transmission. Ninety-four percent (2,143 out of 2,290) were adolescents 10 to 19 years old, and among them 1,957 (91%) were male. Ninety-five percent of the adolescents were infected through sexual contact (252 male-female sex; 1,277 male-male sex; and 504 sex with both males & females), 86 (4%) were infected through sharing of infected needles, 8 (<1%) through mother-to-child transmission, and 16 had no data on the mode of transmission [Figure 8].

Fig. 8: Modes of transmission among children and adolescents, Jan 1984 - Jun 2018 (N=2,290)

Overseas Filipino workers

Eighty-two people who worked overseas within the past five years of diagnosis, whether on land or at sea, were newly diagnosed in June 2018. They comprise 8% of the total newly diagnosed cases for the month. Eighty-nine percent (73) were male. All of the newly diagnosed were infected through sexual contact (18 male-female sex, 43 male-male sex, and 21 sex with both males and females). The ages of male OFWs ranged from 20 to 54 years (median: 31 years). Sixty percent of the cases belonged to the 25-34 year age group. Among the female OFWs diagnosed in June 2018, one case was from 15-24 age group, two cases were from the 25-34 age group, four cases from the 35-49 age group, and two cases from the 50 & older age group. The age range among newly diagnosed female OFWs was 20 to 54 years (median: 36 years).

From January 1984 to June 2018, out of the 56,275 cases, 5,889 (10%) were OFWs (Figure 9). Of these, 5,063 (86%) were male. Majority of the male cases (71%) were infected through sexual contact among MSM (2,062 male-male sex and 1,529 sex with both males & females). The ages of male OFWs ranged from 16 to 80 years (median: 32 years). Among female OFWs, ages ranged from 20 to 73 years (median: 34 years old).

Fig. 9: Number of reported OFW diagnosed with HIV, Jan 1984 - Jun 2018 (N=5,889)

People who engage in transactional sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

In June 2018, 12% (122) of the newly diagnosed engaged in transactional sex [Table 4]. Ninety-seven percent (118) were male and aged from 18 to 63 years old (median: 29 years). More than half of the males (53%, 62) reported paying for sex only, 31% (37) reported accepting payment for sex only and 16% (19) engaged in both. Among the female cases who engaged in transactional sex, two cases each were reported for accepted payment for sex and engaged in both.

A total of 5,337 cases reported to HARP from December 2012 to June 2018 were people who engaged in transactional sex. Ninety-six percent (5,112) were male and 4% (225) were female. There were 2,844 (53%) who

paid for sex, 1,664 (31%) accepted payment for sex, and 829 (15%) engaged in both [Table 4].

Table 4. Age and sex of people diagnosed with HIV who engaged in transactional sex

Type of Transactional Sex	Jun 2018 (N=122)	Jan–Jun 2018 (N=702)	Dec 2012–Jun 2018 (N=5,337)
Accepted payment for sex only:	39 (32%)	238 (34%)	1,664 (31%)
Male	37	215	1,536
Female	2	23	128
Age Range (Median)	18-49 (25)	14-49 (26)	14-68 (26)
Paid for sex only:	62 (51%)	363 (52%)	2,844 (53%)
Male	62	360	2,825
Female	0	3	19
Age Range (Median)	20-63 (30)	17-70 (30)	16-79 (31)
Engaged in both:	21 (17%)	101 (14%)	829 (16%)
Male	19	95	751
Female	2	6	78
Age Range (Median)	21-54 (28)	18-54 (29)	16-62 (28)

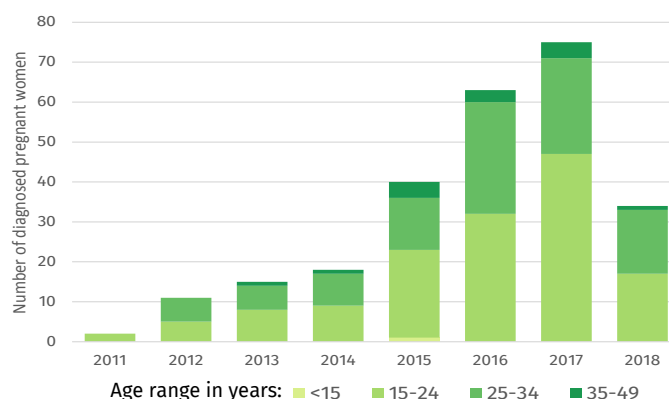

Pregnant women living with HIV

Reporting of pregnancy status at the time of testing was included in the HARP from the year 2011.

In June 2018, four newly diagnosed women were reported to be pregnant. Three of the cases were from NCR and one was from Region 7. The age at diagnosis ranged from 19 to 35 years old (median age: 27 years).

Since 2011, a total of 262 diagnosed pregnant women were reported. More than half (55%, 144) were 15-24 years old at the time of diagnosis, and 39% (101) were 25-34 years old. The regions with highest number of diagnosed pregnant women with HIV were NCR (49%), Region 7 (25%), Region 4A (9%), and Region 3 (6%) [Figure 10].

Fig. 10: Number of women who were pregnant at the time of diagnosis by age group, Jan 2011 - Jun 2018 (N=262)

DEATHS AMONG PEOPLE WITH HIV

In June 2018, there were 77^a reported deaths due to any cause among people with HIV. Seventy-two were males and five were females [Table 5]. Fifteen (19%) were 15-24 years old, 39 (51%) cases were from 25-34 years old, 16 (21%) cases were from 35-49 years old age group, and seven (9%) case were 50 years & older. Ninety percent of the cases were reported to have acquired the infection through sexual contact (12 through male-female sex, 36 through male-male sex, and 21 through sex with both males & females), and 10% (8) of the cases were infected through sharing of needles.

A total of 2,705 deaths were reported from January 1984 to June 2018. Ninety percent (2,434) were male. Nineteen (1%) were less than 15 years old at the time of death, 414 (15%) were 15-24 years old, 1,320 (49%) were 25-34 years old, 762 (28%) were 35-49 years old, and 187 (7%) were 50 years and older [Table 5]^b. Sexual transmission (96%) was the most common mode of HIV transmission (605 male-female sex, 1,268 male-male sex, 729 sex with both males and females). There were 45 reported deaths among those who were infected through sharing of needles, 18 deaths among those who were infected through mother-to-child transmission, and nine among those who were infected through blood transfusion [Figure 11]^c.

^a The date of death does not necessarily fall in this reporting month

^b No data available on age for 3 cases

^c No data available on mode of transmission for 23 cases

HIV/AIDS & ART Registry of the Philippines (HARP)

The Philippine HIV/AIDS & ART Registry of the Philippines (HARP) is the official record of the total number of laboratory-confirmed HIV positive individuals, and deaths in the Philippines. All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the National Reference Laboratory (NRL) of the Department of Health (DOH) for HIV/AIDS. Mandatory HIV testing is unlawful in the Philippines (Republic Act 8504).

The process of reporting to the HARP is as follows: All blood samples from accredited HIV testing facilities that are screened HIV reactive are sent to SACCL for confirmation by Western Blot. Confirmed HIV positive individuals are reported to the DOH-Epidemiology Bureau (EB) and are recorded in the HARP.

The HARP is a passive surveillance system. Except for HIV confirmation by the NRL, all other data submitted to the HARP are secondary and cannot be verified. For example, the HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.
