HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

Average number of people newly diagnosed with HIV per day, selected years[a]

NEWLY DIAGNOSED CASES

In December 2021, there were 993 confirmed HIV-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP) [Figure 1]. Fourteen percent (143) had clinical manifestations of advanced HIV infection[b] at the time of testing [Table 1].

Thirty percent (298) were from the National Capital Region (NCR). Other regions that comprised the top five of newly reported cases for this reporting period were Regions 4A, 3, 6 and 7; together accounting for 77% of the total cases. No new case was reported from BARMM [Figure 2].

Sexual contact remained the predominant mode of transmission (98%, 971). Among the newly reported cases who acquired HIV through sexual contact, 63% (608) were through male to male sex, 27% (261) through males who have sex with both males and females[c], and 10% (102) through male to female sex. Further, seven (1%) were infected through sharing of infected needles, three (<1%) children acquired HIV through mother-to-child transmission, and 12 cases (1%) had no data on mode of transmission.

Moreover, there were four HIV positive women reported pregnant at the time of diagnosis. Three cases were from Region 4A, and one case was from Region 8. The age of reported case ranged from 20 to 23 years.

Table 1: Summary of HIV diagnoses and deaths

Demographic Data	Dec 2021	Jan-Dec 2021	Jan 2016-Dec 2021	Jan 1984-Dec 2021
Total reported cases	993	12,341	64,593	94,337
Advanced HIV infection[b]	143	1,902	10,178	12,667

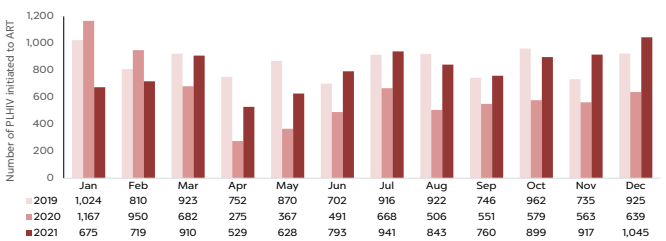
Anti-retroviral Therapy

In December 2021, there were 1,045 people with HIV who were initiated on ART. One thousand forty-three were on the first line regimen, and two were on third-line regimen. The median CD4 of these patients upon enrollment was at 204 cells/mm^3.

A total of 56,385 people living with HIV (PLHIV) were presently on ART as of December 2021. Ninety-six percent (54,269) were males. The age of reported cases ranged from 1 to 81 years (median: 32 years old). Ninety-six percent were on the first line regimen, 4% were on the second line, and <1% were on the third line of regimen.

Fig. 3: Number of ART initiation per month, 2019-2021



Note:
Due to reporting delay, data from previous month (Nov2021) were used for Chinese General Hospital and Talisay CHO in updating their treatment outcome for this reporting period.

[a] *Computation was based on the cumulative cases (12,341) of the reporting year (Jan- Dec 2021)*
[b] *WHO clinical stage 3 or 4*
[c] *Among males only (sex assigned at birth)*
[d] *No data on sex for 11 cases*
[e] *No data on age for 72 cases*
[f] *Pregnant at the time of diagnosis*
[g] *Reported deaths due to any cause and not necessarily AIDS-related*

EPIDEMIC TRENDS OF HIV/AIDS IN THE PHILIPPINES, JAN 1984-DEC 2021

The first case of HIV infection in the Philippines was reported in 1984. Since then, there have been 94,337 confirmed HIV cases reported to the HARP [Figure 4]. Ninety-four percent (88,818) of those diagnosed were male[h] and 6% (5,508) were female[h]. At the time of diagnosis, more than half (51%, 47,868) were 25-34 years old[i] while 29% (27,254) were youth (15-24 years old[i]). The median age was 28 years old (age range: 1 month - 82 years). Thirteen percent (12,667) of the reported cases had clinical manifestations of advanced infection[j] at the time of testing. Moreover, there was a 54% increase in the annual diagnosed cases reported in 2021 (12,341) compared to the reported cases in 2020 (8,036) [Figure 4].

Sex and Age

In the early years of the epidemic (1984-1990), 62% (131 of 213 cases) of those diagnosed were female. However, since start of 1991, the proportion of diagnosed males has been greater than that of females each year. In the past 10 years (2011-2021), proportion of diagnosed cases among males were more than 95%.

The number of diagnosed HIV infections among females has also been increasing since January 1984 [Figure 5]. From January to December 2021, 548 females were diagnosed with HIV, which was almost four times higher compared with cases reported in 2011 (152). Ninety-two percent (5,093) of all female cases since 1984 were in the reproductive age group (15-49 years old) at the time of testing. Further, there were 26 females with no data on age.

The predominant age group among those diagnosed has shifted to 25-34 years old starting 2006 from 35-49 years old in 2001 to 2005 [Figure 6]. In addition, the proportion of HIV positive cases in the 15-24 year age group increased in the past 10 years, from 22% in 2001 to 2010 to 29% in 2011 to 2021.

Fig. 5: Cumulative number of diagnosed females per year, Jan 1984-Dec 2021 (n=5,508)

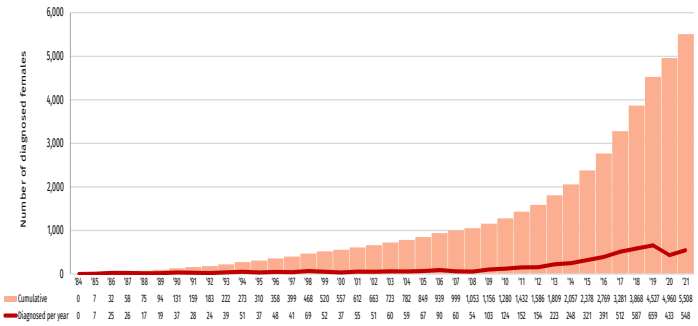

Fig. 6: Proportion of HIV cases by age group, Jan 1984-Dec 2021 (N=94,337)[i]

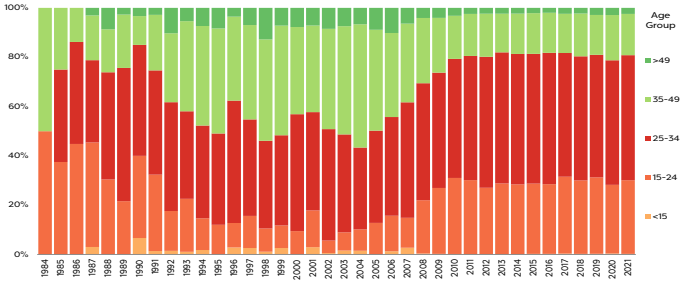

Geographic Distribution

From January 1984 to December 2021, the regions with the most number of reported cases were NCR with 34,329 (36%) cases followed by Region 4A with 14,932 (16%) cases, Region 3 with 9,566 (10%) cases, Region 7 with 7,920 (9%) cases, and Region 6 with 5,384 (6%) cases. Twenty-two percent (21,113) of the cases came from the rest of the country while 1,093 (1%) did not report region of residence [Table 2].

Of the 5,508 females reported with HIV, 1,427 (26%) were from NCR, 832 (15%) were from Region 3, 705 (13%) were from Region 4A, and 673 (12%) were from Region 7. Furthermore, 1,581 (29%) were from other regions, while 290 (5%) had no reported data on region of residence.

The regions with the most number of Overseas Filipino Workers (OFW) reported to HARP were from NCR with 2,574 (31%) cases, Region 4A with 1,483 (18%) cases, and Region 3 with 1,055 (13%) cases. Further, 2,947 (35%) cases were from other regions and 266 (3%) had no data on region of residence.

Table 2: Number of HIV cases diagnosed by region of residence

Region	Dec 2021 (n=993)	Jan-Dec 2021 (n=12,341)	Jan 2016-Dec 2021 (n=64,593)	Jan 1984-Dec 2021 (N=94,337)[k]

[h] No data on sex for 11 cases
[i] No data on age for 72 cases
[j] WHO clinical stage 3 or 4
[k] No data on region of residence for 1,093 (1%) cases

Modes of Transmission (MOT)

From January 1984 to December 2021, sexual contact among males who have sex with males [MSM] (81%, 76,658) was the predominant MOT, followed by male-female sex (15%, 13,855), and sharing of infected needles (3%, 2,404). More than half of MSM (52%, 40,019) were 25-34 years old at the time of testing, and 31% (23,701) were 15-24 years old. Among diagnosed females, male-female sex was the most common MOT (93%, 5,126) followed by sharing of infected needles (3%, 143) [Table 3].

A total of 236 children (less than 10 years old[i]), nine adolescents (10-19 years old[i]), and one adult foreigner (22 years old[i]) were reported to have acquired HIV through mother-to-child transmission.

From 1984 to 2006, the most common MOT (62%, 1,653) was male-female sex. From 2007, the trend shifted to sexual contact among MSM as the predominant MOT and has remained as such to the present. From January 2016 to December 2021, 85% (54,682) out of the total (64,593) diagnosed cases were MSM.

From 1984 to 2009, transmission through sharing of infected needles was less than one percent of the total cases reported. In 2010, 9% (147) of the total cases (1,553) reported were among people who inject drugs (PWID). However, the proportion of new reported cases among PWID remained at less than 3% of the total cases in the past five years.

Table 3: Modes of HIV Transmission

Mode of Transmission	Dec 2021 (n=993)		Jan-Dec 2021 (n=12,341)		Jan 2016-Dec 2021 (n=64,593)		Jan 1984-Dec 2021 (N=94,337)[n]	
	M[m] (952)	F[m] (41)	M (11,793)	F (548)	M (61,463)	F (3,130)	M (88,818)	F (5,508)
Sexual Contact	930	41	11,450	518	59,696	2,962	85,387	5,126
Male-female sex	*61*	*41*	*717*	*518*	*5,014*	*2,962*	*8,729*	*5,126*
Male-male sex	*608*	-	*7,527*	-	*37,852*	-	*51,344*	-
Sex w/ males & females°	*261*	-	*3,206*	-	*16,830*	-	*25,314*	-
Blood /blood products	0	0	0	0	0	0	5	14
Sharing of infected needles	7	0	89	7	1,046	58	2,261	143
Needlestick injury	0	0	0	0	0	0	2	1
Mother-to-child	3	0	13	11	84	78	129	117
No data	12	0	241	12	637	32	1,034	107

Regional patterns vary across different MOT. Thirty-nine percent (29,630) of ever diagnosed males who have sex with males were from NCR; almost all (99%, 2,397) reported cases among people who inject drugs were from Region 7; and the highest proportion of females who engaged in transactional sex (31%, 100) were from Region 3.

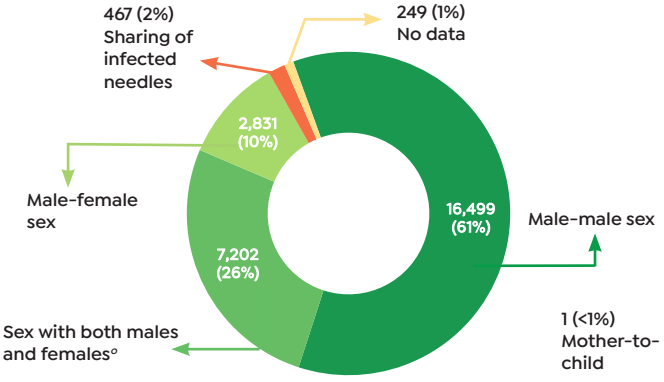
SPECIFIC POPULATION

Youth (15-24 years old)

In December 2021, 306 (31%) cases were among youth 15-24 years old and 96% were male. Ninety-nine percent (304) cases were infected through sexual contact (26 male-female sex, 209 male-male sex, 69 sex with both males & females°), while two cases had no data on MOT.

From January 1984 to December 2021, 27,254 (29%) of the reported cases were 15-24 years old. Ninety-seven percent (26,532) were infected through sexual contact (2,831 male-female sex, 16,499 male-male sex, 7,202 sex with both males & females°), 467 (2%) were infected through sharing of needles, one (<1%) was infected through mother-to-child transmission, and 254 (1%) had no data on MOT [Figure 7]. At the time of testing, 71% (19,263 out of 27,254) of youth were diagnosed from January 2016 to December 2021. Since 2004, more males were diagnosed from this age group. However, the number of diagnosed HIV cases among female youth had increased significantly in the past five years. The total diagnosed females aged 15-24 years old in January to December 2021 (163) was almost four times higher compared with the same reporting period (37) in 2011.

Fig. 7: MOT among youth, Jan 1984-Dec 2021 (n=27,254)



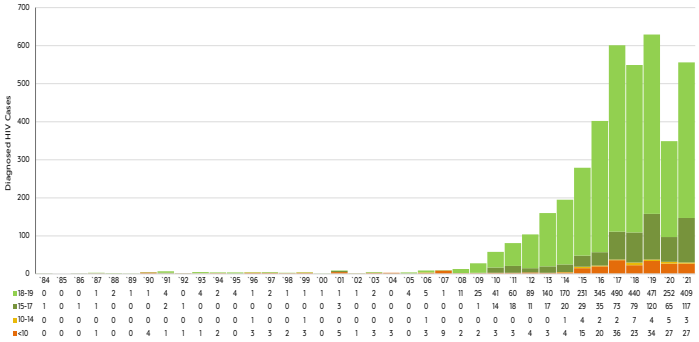
Children (<10) & Adolescents (10-19)

In December 2021, there were 40 newly reported adolescents. Of these, 23% (9) were 15-17 years old, and 77% (31) were 18-19 years old. All adolescents were infected through sexual contact (one male-female sex, 29 male-male sex, 10 sex with both males & females°). Further, there were three newly diagnosed children and all were infected through mother-to-child transmission.

Four percent (4,100) of all diagnosed cases from January 1984 to December 2021 were 19 years old or younger at the time of diagnosis. Among the total, 248 (6%) were less than 10 years old at the time of testing, 31 (1%) were 10-14 years old, 608 (15%) were 15-17 years old, and 3,213 (78%) were 18-19 years old [Figure 8].

There was an increase of cases reported among age groups 15-17 and 18-19 in 2019, following the ratification of the Philippine HIV and AIDS Policy Act (RA 11166). Diagnosed cases in 2019 (120) among 15-17 years old were five times higher compared to 2014 (20) while 18-19 years old were almost two times higher in comparisson of the same reporting period of 2019 (471) and 2014 (170).

Fig. 8: Diagnosed cases among children and adolescents by age group, Jan 1984-Dec 2021 (n=4,100)



[i] Age was based at the time of testing
[m] Sex at birth; M=Male, F=Female
[n] No data on MOT and sex for 11 cases
° Among males only

Transgender Women (TGW)[p]

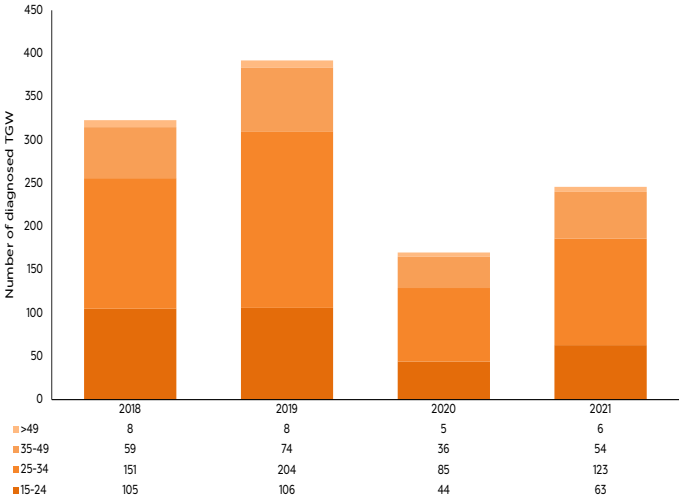
Reporting of gender identity was included in the HARP starting year 2018. TGW were males (sex assigned at birth) who reported their gender identity as female at the time of testing.

In December 2021, there were 17 TGW diagnosed with HIV. Among them, 41% (7) were 25-34 years old, 24% (4) 15-24 years old, and 35% (6) were 35-49 years old. The age of diagnosis ranged from 22 to 45 (median: 32).

A total of 1,131 TGW were diagnosed from January 2018 to December 2021. Almost all (99%, 1,121) of the cases acquired HIV through sexual contact and less than 1% (3) through sharing of infected needles. Seven (1%) TGW had no data on MOT.

Further, half (50%, 563) of the TGW were 25-34 years old at the time of testing, 28% (318) were 15-24 years old, 20% (223) were 35-49 years old, and 2% (27) were 50 years and older [Figure 9]. The median age of diagnosis was 28 years old (age range: 15 to 63 years old).

Fig. 9: Number of diagnosed TGW by age group, Jan 2018-Dec 2021 (n=1,131)



Transactional Sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

In December 2021, 11% (106) of the newly diagnosed engaged in transactional sex [Table 4]. Ninety-nine percent (105) were male. Their age ranged from 18 to 55 years old (median: 30 years old). Almost half (43%, 45) of the males reported paying for sex only, 37% (39) reported accepting payment for sex only and 20% (21) engaged in both. One 24-year old female was diagnosed in the reporting period and reported to have accepted payment for sex.

A total of 10,017 cases reported to HARP from December 2012 to December 2021 were people who engaged in transactional sex. Ninety-seven percent (9,698) were male. There were 5,367 (54%) who paid for sex, 3,161 (31%) who accepted payment for sex, and 1,489 (15%) who engaged in both [Table 4].

Table 4: Age and sex of people diagnosed with HIV who engaged in transactional sex

Type of Transactional Sex	Dec 2021 (n=106)	Jan-Dec 2021 (n=1,382)	Jan 2016-Dec 2021 (n=7,526)	Dec 2012-Dec 2021 (N=10,017)
Accepted payment for sex only	40 (38%)	450 (33%)	2,427 (32%)	3,161 (31%)

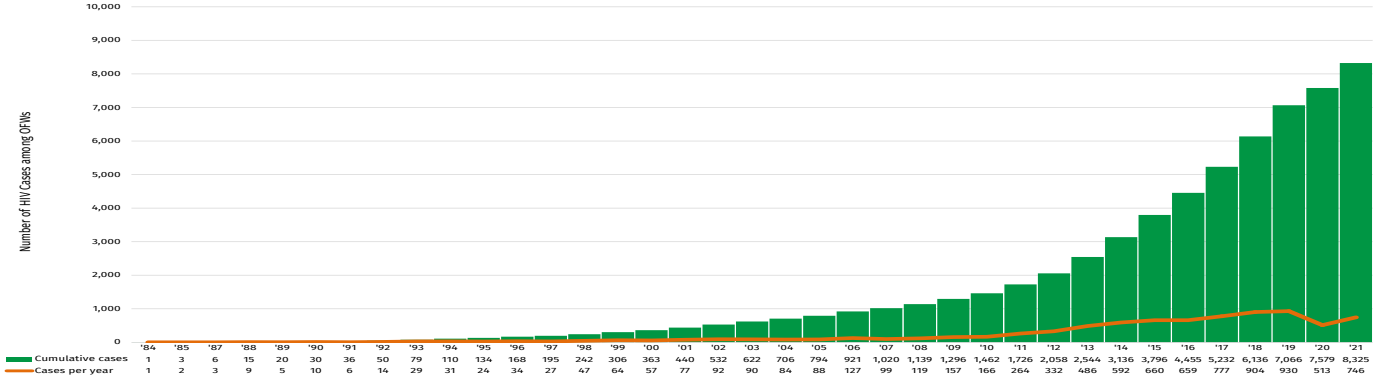
Age Range (Median)	18-43 (32)	16-63 (30)	15-63 (29)	15-63 (29)

Overseas Filipino Workers (OFW)

Fifty-three Filipinos who worked overseas within the past five years, whether on land or at sea, were newly reported in December 2021. They comprised 5% of the total cases for this period. Of these 94% (50) were male. Further, all of the male cases were infected through sexual contact (10 male-female sex, 23 male-male sex, and 17 sex with both males and females[q]). The age of male OFWs ranged from 23 to 59 years old (median: 33 year old). Fifty-four percent (27) of the male cases were 25-34 years old , 38% (19) were 35-49 years old, 4% (2) cases each in 15-24 years old and 50 years & older at the time of testing. All of the female (3) OFWs were infected through sexual contact and among 25-34 years old. The age among diagnosed female OFWs ranged from 27 to 33 years old (median: 28 years old).

From January 1984 to December 2021, 9% (8,325) of the total cases were OFWs [Figure 10]. Of these, 7,286 (88%) were male. Almost all (98%, 7,171) of male cases were infected through sexual contact (1,698 male-female sex, 3,263 male-male sex and 2,210 sex with both males and females[q]). The ages of male OFWs ranged from 16 to 80 years (median: 32 years). Among 1,039 female OFWs, 97% (1,012) were infected through sexual contact. The ages of female OFWs ranged from 20 to 73 years old (median: 35 years old).

Fig. 10: Cumulative number of diagnosed cases among OFW, Jan 1984-Dec 2021 (n=8,325)



[p] Of the total 42,217 male (sex at birth) cases in Jan 2018-Dec 2021, 30% (12,649) had no data on self-identity

[q] Among males only

Pregnant Women with HIV

Reporting of pregnancy status at the time of diagnosis was included in the HARP starting year 2011.

From January to December 2021, there were 79 HIV positive women reported pregnant at the time of diagnosis. Of these, 37% (29) were from NCR, 22% (17) were from Region 4A, 15% (12) Region 3, 10% (8) were from Region 7, 4% (3) each from Regions 6 and 8, and 8% (7) were from the rest of the country. The age of diagnosis ranged from 15 to 39 years old (median age: 24).

Since 2011, a total of 610 diagnosed women were reported pregnant at the time of diagnosis. More than half (52%, 316) were 15-24 years old and 41% (248) were 25-34 years old [Figure 11]. The regions with highest number of diagnosed pregnant cases with HIV were NCR (43%, 264), Region 7 (17%, 105), Region 4A (13%, 80), Region 3 (10%, 60), and Region 11 (4%, 22).

Mortality

In December 2021, there were 50[r] reported deaths due to any cause among people with HIV. Ninety-eight percent (49) were males. Twelve (24%) cases were 15-24 years old, 26 (52%) were 25-34 years old, 11 (22%) were 35-49 years old and one (2%) was 50 years and older [Figure 12]. There was no reported case for <15 years old. Thirty-eight percent (19) were from Region 3. Region 6, Region 4A, NCR, and Region 9 comprised the top regions with the most number of deaths.

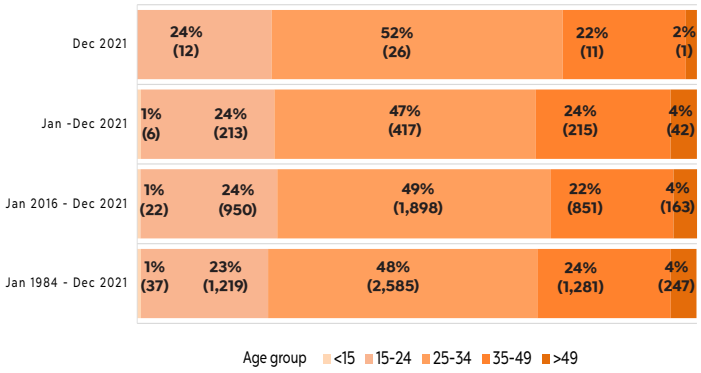
A total of 5,373 deaths were reported from January 1984 to December 2021, and 92% (4,964) of whom were male. Thirty-seven (<1%) were less than 15 years old[s] at the time of death, 1,219 (23%) were 15-24 years old[s], 2,585 (48%) were 25-34 years old[s], 1,281 (29%) were 35-49 years old[s], and 247 (4%) were 50 years and older[s] [Figure 12].

From 1984 to December 2021, the top 5 regions with the most number of reported deaths were NCR, Region 4A, Region 3, Region 6, and Region 7. Further, 126 (2%) cases had no data on region of residence [Table 5].

Table 5: Proportion of reported deaths by region of residence

Region	Dec 2021 (n=50)	Jan-Dec 2021 (n=893)[t]	Jan 2016-Dec 2021 (n=3,884)[u]	Jan 1984-Dec 2021 (N=5,373)[v]
NCR	4 (8%)	325 (36%)	1,178 (30%)	1,727 (32%)
4A	6 (12%)	139 (16%)	569 (15%)	737 (14%)
3	19 (38%)	131 (15%)	504 (13%)	624 (11%)
6	14 (28%)	78 (8%)	409 (11%)	529 (10%)
7	0	54 (6%)	256 (6%)	358 (7%)
Rest of the country	7 (14%)	166 (19%)	968 (25%)	1,398 (26%)

Fig. 12: Proportion of reported deaths among people with HIV by age group, Jan 1984-Dec 2021(N=5,373)[s]



[r] Based on reported date. Hence, actual date of death may not necessarily fall in this reporting period
[s] No data available on age for four cases
[t] Ten (1%) cases had no data on region of residence
[u] 16 (<1%) cases had no data on region of residence
[v] 126 (2%) cases had no data on region of residence

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

The HARP is the official record of total number of diagnoses (laboratory-confirmed), ART outcome status and deaths among people with HIV in the Philippines. All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the HIV/AIDS National Reference Laboratory (NRL) and DOH Certified Rapid HIV Diagnostic Algorithm - rHIVda Confirmatory Laboratories (CrCLs). Confirmed HIV positive individuals were reported to the DOH-Epidemiology Bureau (EB) and recorded to HARP. ART figures are counts of HIV positive adult and pediatric patients currently enrolled and accessing Antiretroviral (ARV) medication during the reporting period in 170 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV. Lost to follow-up is considered once a person have failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

HARP is a passive surveillance system. Except for HIV confirmation by the NRL & CrCLs, all other data submitted to the HARP are secondary and cannot be verified. Hence, HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.

FACILITIES DESIGNATED AS HIV TREATMENT HUBS/PRIMARY CARE AND CERTIFIED RHIVDA CONFIRMATORY LABORATORIES

Region	Name of Facility	Address	Landline	Mobile
1	Ilocos Training and Regional Medical Center	Parian, San Fernando City, La Union	(072) 6076418 (072) 6079912	-
